Face enumeration on matroid base polytope

Marko Pešović¹

¹Department of Mathematics, Physics and Descriptive Geometry, Faculty of Civil Engineering, University of Belgrade, Serbia, mpesovic@grf.bg.ac.rs

To a generalized permutohedron Q is associated the quasisymmetric function $F(Q)$, defined in [1], which enumerates positive integer lattice points lying in maximal cones of the normal fan of Q . In [2] is defined its weighted refinements $F_q(Q)$

$$F_q(Q) := \sum_{\omega \in \mathbf{Z}_+^n} q^{\text{rk}_Q(\mathcal{F}_\omega)} x_{\omega_1} x_{\omega_2} \cdots x_{\omega_n},$$

where $\text{rk}_Q(\mathcal{F}_\omega)$ is a rank function on the face poset of the standard permutohedron determined by Q . Particularly, the enumerator $F_q(Q)$ contains the information about the f -vector of the generalized permutohedron Q . We study the special case of matroid base polytopes $Q = P_M$ and calculate their f -vectors. We also show that the corresponding weighted quasisymmetric enumerator $F_q(P_M)$ coincides with a universal morphism of combinatorial Hopf algebras of matroids to quasisymmetric functions.
